TITLE: History of Mineralogical Investigations in Siberia (the
Work of Grigoriy Markianovich Permikin). /Iz istorii
mineralogicheskikh issledovaniy Sibiri (Raboty Grigoriya
Markianovicha Permikina)/

PERIODICAL: V sb: Ocherki po istorii geol. znaniy. Nr 5, Moscow,
AN SSSR, 1956, pp 155-175.

ABSTRACT: The Russian geologist G. M. Permikin (circa 1813-1879)
is well known as the investigator of the Baikal
districts, of the eastern outskirts of Sayan and other
parts of Eastern Siberia. In 1850 Permikin was sent
to Siberia in search of nonferrous rocks. He began his
work in trans-Baikal district with the search for
lazulite in the alluvial deposits of the Slyudyanka
River where he was trying to find native deposits.
Having established that lazulite is associated with the

Card 1/3

15-57-5-5694

History of Mineralogical Investigations in Siberia (Cont.)

contact zone of marbled limestone and connected with fissures and with fault breccia where pneumatic processes have occurred, G. M. Permikin used this deduction as a working hypothesis and discovered seven native deposits of lazulite on the Slyudyanka River. Somewhat later he discovered a rich deposit of lapis lazuli on the Malaya Eystraya River. In 1851 he went to Sayan Mountains to prospect for nephrite. Here, on the banks of the Onot River, he uncovered nephrite pebbles. Permikin found that crystallized schists with their subordinate serpentine rocks were the bearers of the Sayan nephrite. On the banks of one of the tributaries of the Kitoy River he discovered the first native formation of nephrite. During the years 1851-1863 G. M. Permikin supplied the Petersburg Lapidary Plant with 657 poods (10761.66 kg) of nephrite at a cost of 40 rubles a pood (instead of 1000 rubles a pood, which the plant had been paying the Bokhara traders). In the 1850's Permikin also discovered in Siberia deposits of marmolite, pimelite, marble, agalmatolite, smoky topaz and many other minerals. He made two geographic maps of the two branches of the Eastern Sayan. In the mid-1850's he went as a geologist on the Amur expedition. He prepared a petrographic map of the

TITLE: Wear and durability of circular rotary cutters

SOURCE: Samoletostroyeniye i tekhnika vozдушного flota, no. 2, 1965, 106-111

TOPIC TAGS: metalworking machine, metal cutting, wear resistance

ABSTRACT: The process of cutting metals by circular rotary cutters has several specific characteristics due to the rotary cutting edge. It has been shown elsewhere that the durability of the cutter is due mainly to the angle of inclination of the plane of the cutting edge. λ. The present author investigates the cutting process of such a cutter with an increase in angle λ from 0° to 90°. The analysis is based on data of scientific-research work performed at the Khar'kov Aviation Institute (Khar'kovskiy aviationsionnyy institut) which was registered at the Committee for Inventions and Discoveries attached to the Council of Ministers SSSR (Komitet po delam izobreteniy i otkrytyi pri Sovete Ministrov SSSR). Certificate No. 27255 was issued on Jan. 30, 1962, and Certificate No. 28918 on May 10, 1962. The re-

Title: Dispersion curves of Rayleigh and Love waves as applied to two- and three-layered continental earth crust

Source: AN SSSR. Izvestiya. Fizika zemli, no. 4, 1965, 38-51

Subject: Earth crust, seismic wave, computer programming, phase velocity, dispersion analysis, surface wave

Abstract: Numerical results of dispersion of Love and Rayleigh waves in two- and three-layered continental crust are presented and analyzed. A method of programming for the computation of dispersion curves is proposed. The authors used a digital computer system. The structure of the crust is assumed to be a two- or three-layered model. The wave data by observing the dependence of group and phase velocities on frequency and by comparing this dependence with the dispersion curves of the corresponding models. The dispersion curves are plotted on a graph. It is found that the dispersion curves of the models differ in relative thickness of the layers and in relative velocities of longitudinal and transverse waves in the layers. This article

Card 1/2

ACCESSION NR: AP5017040

attempt to show the relationships between wave dispersion and possible
variations, but does not attempt to specify what the actual time is
and where the dispersion is due to the presence of a boundary layer
or to the presence of a waveguide. The dispersion is due to the fact that the
fundamental frequency, which is the first overtone, is a result of the
wave's having a finite wavelength as a result of the
dispersion relation. The dispersion relation is given by the formula
 $\omega = \sqrt{\mu_0 \epsilon_0 k^2}$, where ω is the angular frequency, μ_0 is the magnetic permeability of free space, ϵ_0 is the
dielectric constant, and k is the wave number.

The graphical presentation of the dispersion relation is given in
Figure 1 and 2 formulas.

✓ Separation of mixture of alkaloids anabasine and lupinine.
V. V. Udovenko, O. J. Grianova, and L. A. Vvedenskaya
Central Asia State Univ., Tashkent. Sbornik Statei
Obozr. Khim. 2, 1124-6 (1953).—The sepn. is performed
through the Cu salts (cf. following abstr.) as follows. The
mixt. of known compn. of anabasine and lupinine is treated
with a highly concd. soln. of CuCl_2 and HCl or $\text{Cu}(\text{NO}_3)_2$ and
 HNO_3 , made up on the basis of stoichiometrical calcn. to form
either $\text{CuCl}_2 \cdot \text{A} \cdot 2\text{HCl}$ or $\text{Cu}(\text{NO}_3)_2 \cdot 2\text{A} \cdot 4\text{HNO}_3$ (A = ana-
basine), with cooling. The order of addn. is immaterial.
Since the mixt. now contains a ppt. of Cu oxide, addnl. acid
is added to dissolve this (avoid excess of HNO_3). Traces of
kerosine from com. alkaloids are removed at this point by
boiling. The mixt. then yields cryst. salt of anabasine,
which treated with concd. NaOH gives the pure base, which
is purified by distn. *in vacuo*. The evapd. filtrate from the
salt is treated with concd. NaOH and extd. with C_6H_6 .
Evapn. of the ext. yields cryst. lupinine. The HCl salt
gives somewhat better results. Pure anabasine bp. 107-10°,
 n_D^{20} 1.5420, d₄ 1.0460; lupinine m. 19°. *G. M. K.*

ABSTRACT: The automatic programmed counter described in the paper is intended for radioactive substances. It contains 2 counting channels, a time channel, a code converter, an output block, a programming device, a registering unit, and a power supply. The block diagram of the device is given together with a brief description of its operation. The maximum counting rate is 500 c/sec, the input pulse amplitude is 5 to 20 v, output resistance of the pulse source is not more than 10 k Ω , pulse rise time is not longer than 0.5 sec, the maximum channel capacity is 10^7 , the quartz generator instability is not larger than $\pm 5 \cdot 10^5$, and the device can be put on every 2, 5, 10, 20 sec, 1, 5, 10, 20 min, and 1, 2 hr. TITLE: Decade counter with ferrite-transistor elements

SOURCE: Geomagnetizm i aeronomiya, v. 5, 1965, 958-960

TOPIC TAGS: pulse counting, decade counter,

12,44.55

ABSTRACT: A decade counter with three ferrite-transistor flip-flops and one four-winding core with rectangular hysteresis loop is described. As seen from Fig. 1, the T_{p_2} core switches into the 1 state at the count of 8. The ninth and tenth pulses alternately switch the first flip-flop (T_{p_3}) into the 1 and 0 states. Winding w_2 of T_{p_3} transmits this transition to core T_{p_2} and switches it into the 0 state. The pulse emanating at this time from T_{p_2} , winding w_4 , triggers the blocking generator (T_1 and T_{p_1}), which resets all the flip-flops. The counter functions in the ambient temperature range of -30C to +55C. The bias voltage E_k may vary from 9 to 22v without affecting the operation of the counter. The limiting counting frequency is

TITLE: A precise digital recorder of atmospheric pressure

12,44,55

SOURCE: Geomagnetizm i aeronomiya, v. 5, no. 5, 1965, 963-965

TOPIC TAGS: meteorological instrument, barograph, atmospheric pressure recorder

12,44,55

ABSTRACT: An apparatus for recording atmospheric pressure which does not require processing of barograms or visual readings of a mercury barometer is proposed. Atmospheric pressures are measured with an accuracy of ± 0.1 mm Hg and temperatures with an accuracy of $\pm 0.5^{\circ}\text{C}$. The pressure readings are automatically corrected for temperature. The results are displayed on a digital panel, which can be substituted by other recording devices (photographing unit or digital printer); these can be placed at any desired distance from the sensors. Basic elements include a cup-type mercury barometer, a thermoelement (taken from a recording meteorological thermograph), a photocell device for reading mercury-meniscus levels, and a display unit. A schematic diagram of the apparatus is presented in the original article along with a detailed description of its structure and operation. Advantages claimed for the

TITLE: Change in the properties of the surface layer of n-germanium
following bombardment by nitrogen ions with energy 40 kev *B* 27

SOURCE: Fizika tverdogo tela, v. 6, no. 7, 1964, 2017-2021

TOPIC TAGS: germanium, n-type germanium, p-type germanium, radiation damage, lattice defect, radiation effect, ion bombardment

ABSTRACT: The effect of ion bombardment on n-type Ge was investigated in the dose interval 10^{-2} -- 10^4 microcoul/cm² by measuring not only the rectifying characteristics (which do not yield unambiguous results) but also by using four probes to measure the specific resistivity and by using a thermal probe to determine the thermal emf of the sample. The samples were n-type germanium plates with spe-

Card 1/5

L 11373-65

ACCESSION NR: AP4041702

cific resistivity 1 ohm-cm, finished by grinding and chemical polishing. The use of four probes made it also possible to determine reliably the dose interval within which a p-n junction is formed. With increasing dose, the changes in the surface-layer properties were found to go through two principal stages. The first consists of accumulation of point defects without disturbing the long-range order of the crystal structure; the n-germanium is gradually converted during this stage into p-germanium. In the second stage the germanium becomes amorphous and the germanium returns to its initial type of conductivity. Two possible amorphization mechanisms are described, and the test results are interpreted from the point of view of present theories of radiation effects in semiconductors. It is pointed out that similar results are obtained by bombardment with argon, so that the nature of the bombarding ion is not of primary significance. Orig. art. has: 4 figures and 3 formulas.

TITLE: Investigation of electrical conductivity of inversion layers forming in n-type silicon during bombardment by boron ions

SOURCE: Fizika tverdogo tela; v. 7, no. 10, 1965, 2940-2946

TOPIC TAGS: electric conductivity, silicon single crystal, boron, ion bombardment

ABSTRACT: Results were presented of measuring electrical conductivity of inversion layers formed in n-type silicon as a result of bombardment of the surface by boron ions with energies of 25-150 kev. Dependence of electrical conductivity of an inversion layer, formed during boron ion bombardment, on dosage and annealing temperature has qualitatively, a similar character during all energies in the diapazone studied. The effect was studied of radiation dose, temperature and annealing time. With any dosage in the 1-1000 microcoulomb . cm⁻² range, a sufficiently high annealing temperature leads to an electrical conductivity

Card 1/2

UX

L 26620-66

ACC NR: AP5025369

value corresponding to the quantity of boron atoms introduced. The greater the dosage, the higher the annealing temperature needed to reach this state. This possibility of developing inversion layers during bombardment without subsequent annealing was indicated. With a sufficiently large dose of boron ions the effect of injected boron atoms prevailed under the influence of radiation defects; thus the formation of p-type layer in n-silicon was possible without additional annealing. AUTHOR: Grankin, E. P.TITLE: Modeling of problems in electron optics on electroconductive paper

PERIODICAL: Referativnyy zhurnal, Avtomatika, telemekhanika i vychislitel'naya tekhnika, no. 4, 1963, 66 4B366 (Dokl. 4-y Mezhvuz. konferentsii po primeneniyu fiz. i. matem. modelirovaniya v razlichn. otrazlyakh tekhn. Sb. 1; Moscow, 1962, 83-89)

TEXT: The author makes a study of modeling plane and axisymmetric potential fields on the normal type of electroconductive paper. As examples, the author takes up the modeling of a plane potential created by a diaphragm with aperture; the field of an electrostatic photomultiplier with focussing electrons; and the field of a linear multiplier. A solution of the problems of electron optics requires greater accuracy than that of the theory of filtration, hydrodynamics, etc. Therefore, in the problems examined, the anisotropism of the paper was taken into account. The author presents his results for modeling the problems referred to. The examples show that electroconductive paper as a means for modeling electron optics problems gives sufficiently accurate results for practical use. There are three illustrations and 2 tables; the bibliography contains 4 items. V. Zh.

TITLE:

Solution of the inverse problem of electronic optics
with the aid of fields having an axis of symmetry

PERIODICAL:

Akademiya nauk Ukrayins'koyi RSR. Dopovidi, no. 12,
1962, 1546-1549

TEXT:

The inverse problem of electron optics is defined as that of finding the distribution of potential required for a trajectory of given form. The author considers a locus without cusps, tac-cusps or turning-points. In this case, the solution of the equations of motion of the electrons will give a family of trajectories with the abscissa as axis of symmetry. By noting that the abscissa will also be an axis of symmetry for the required field, and taking the parameter of the family a to be small, the distribution of potential on the axis of symmetry is obtained in the form

$$\frac{dp}{dx} = - p^2 - kp \frac{f'(x)}{f(x)} - r \frac{f''(x)}{f(x)} \quad (3)$$

Card 1/2

S/021/62/000/012/003/018
D251/D308

Solution of the inverse problem ...

where $p = \dot{\Phi}'(x)/\dot{\Phi}(x)$, $f(x)$ is the equation of the trajectory $k = 1$, $r = 2$ for fields with plane symmetry; $k = 2$, $r = 4$ for fields with an axis of revolution. A solution of $\dot{\Phi}(x)$ is sought in the form of an exponential, with index $p(x)$, where $p(x)$ is a solution of (3). By considering the energy corresponding to the potential distribution along the axis, and also the Hamilton function expressed in terms of electron velocity, the problem is reduced to the solution of Riccati's equation and ordinary first-order differential equations. The cases of rectilinear and parabolic trajectories are considered as examples.

TITLE: Solution of a converse problem of corpuscular optics for plane electrostatic fields

SOURCE: AN UkrSSR, Institut matematiki, Seminar po prikladnoy matematike, Trudy, v. 1, no. 1, 1963, 28-52

TOPIC TAGS: electromagnetic field, trajectory, differential equation, Laplace equation, harmonic function, analytic function, charged particle, electrostatic field, corpuscular optics, boundary value problem, Cauchy integral

ABSTRACT: The paper is concerned with the converse problem of corpuscular optics: To determine the nature of a field when the trajectories of charged particles moving through the field are known. It is assumed that the fields under consideration are electrostatic, and that the potentials of the field satisfy Laplace's equation

$$\frac{\partial^2 \varphi}{\partial x^2} + \frac{\partial^2 \varphi}{\partial y^2} = 0.$$

Card 1/2

L 36314-65

ACCESSION NR: AT5007345

It is also assumed that two arbitrary trajectories of a trajectory family are given for each given, closed trajectory. The problem is reduced to an equation

$$\text{where } \frac{\partial f_i(t)}{\partial n} + \frac{\partial \bar{f}_i(t)}{\partial n} = \frac{2}{\rho^*(t)} [f_i(t) + \bar{f}_i(\bar{t})], \quad (2)$$

$$\frac{\partial \varphi}{\partial x} = \frac{\partial \psi}{\partial y}, \quad \frac{\partial \psi}{\partial y} = -\frac{\partial \varphi}{\partial x}, \quad f_i(z) = \varphi(x, y) + i\psi(x, y). \quad (3)$$

and $\rho^*(t)$ is the radius of the contour \mathcal{L} in complex form, t being the points of \mathcal{L} . The function $f_i(z)$ is then determined by means of Cauchy's integral formula. This method gives a solution to the third boundary value problem for harmonic functions. Orig. art. has: 80 formulas.

TOPIC TAGS: broadband component, ferrite, waveguide element, polarization, ribbed waveguide

TRANSLATION: A method is described for decreasing the dispersion of the polarization plane rotation angle in a ferrite unit, using a round waveguide having four removable metal ribs. The shape of the rib is that of an isosceles trapezoid. Three sets of ribs, differing in height, were investigated. The thickness of the ribs remains constant. Twelve brands of ferrites were investigated, of

Card 1/2

L 10865-65
ACCESSION NR: AR4046558

which the most satisfactory from the point of view of activity and matching were the batches M-188 and M-18. Optimal dimensions of the samples are presented. Plots are presented of the polarization plane rotation angle and of the VSWR on the frequency (8.3--9.7 Gc) for a usual waveguide and a waveguide with ribs. It is noted that the use of a ribbed waveguide increases the broadband characteristics. The equipment is recommended for gates, switches, non-reciprocal phase shifters, and single sideband modulators. V. S.

of the modulators relative to the elements of the system. The sensitivity of the system and the maximum measurement error due to the insufficient suppression of the carrier in the balanced modulator are determined. The construction of a ferrite modulation device and the ferrite phase shifter circuit are shown. The characteristics of a phase shifter are presented, plotted under amplitude, balanced, and phase modulation. A. M.

TITLE: Errors in measurement of phase shifts at shf by some interference-type systems

SOURCE: IVUZ. Radiotekhnika, v. 8, no. 1, 1965, 72-77

TOPIC TAGS:phase measurement, shf phase measurement *AM*

ABSTRACT: Methods are considered of shf phase measurements by the interference-type systems in which a measuring line is used as a reference phase shifter (see Figs. 1, 2, and 3 of the Enclosure). An analysis of errors due to mismatch of individual elements and to the attenuation introduced by the test element permits drawing these conclusions: (1) The circuit shown in Fig 1 of the Enclosure is suitable for testing the elements that have low attenuation and low voltage standing wave ratio(SWR); (2) The circuits shown in Figs. 2 and 3 of the Enclosure should be used for testing the elements with higher attenuation and voltage SWR; (3) Phase modulation permits eliminating the effect of attenuation on the error and facilitates the measuring process. Orig. art. has: 3 figures and 28 formulas.

TITLE: The protection of communications from nuclear weapons

SOURCE: Voyenny vestnik, no. 8, 1966, 106-108

TOPIC TAGS: fallout shelter, nuclear warfare, nuclear defensive training, communication site

ABSTRACT: The protection of communication sites from shock waves produced by nuclear blasts, from radioactive radiation, and contamination as regards detached commands and vehicles is discussed. Protection against the shock wave is best achieved by placing the communication posts in naturally and artificially protected areas--clearings in woods, trenches, holes, ravines, cellars, bridges, tunnels, etc. In regard to protection against radiation and contamination, instructions are presented for the construction and equipment of a simple shelter, with radioactivity measurement instruments, which can be completed by 6-7 men and equipment in 3 to 3.5 hr. TITLE: Hydraulic brake fluid. Class 23, No. 172944

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 14, 1965, 64

TOPIC TAGS: brake fluid, anticorrosion additive, antifreeze

ABSTRACT: This Author's Certificate introduces a hydraulic brake fluid based on xylithane, methanol fraction, anticorrosion additives and thickening agents. The fluid is made more resistant to freezing, the rate of corrosion in the sleeves is reduced and a wider selection of raw materials is provided by adding 300 wt. % furfural to a 1:1 mixture of xylithane and methanol fraction.

TITLE: Electric properties of thin coatings of nichrome. II. Thermal coefficient of resistivity

SOURCE: Fizika metallova i metallovedeniye, v. 19, no. 6, 1965, 840-844

TOPIC TAGS: electric resistivity, nimonic alloy, thin film, high temperature, high temperature metal, silver, metal physics

ABSTRACT: The temperature coefficients of resistivity ($\alpha_{200-500} \times 10^3 \text{ deg}^{-1}$) of nichrome coatings (100 to 3000 Å) were studied in a temperature range of 300 to 1000 K. For testing, the specimens were heated in a vacuum of $5 \cdot 10^{-5} \text{ mm Hg}$; some tests were also made on silver coatings for the same conditions. The character of the change of α with temperature remained the same for both cases: with rise in the temperature of heating in a vacuum α also increased. Corrections in Matthewson's rule for resistivity were made to take account of the dispersion of the conducting electrons by the surface of the coating. The final equation evolved was:

$$\rho = \rho_1 + \rho_2 + \rho_3$$

Card 1/2

L 60443-65

ACCESSION NR: AP5016524

where ρ is total resistivity, ρ_T is thermal resistivity, ρ_i is resistivity due to impurities, and ρ_s is resistivity due to surface effects. The temperature coefficient of resistivity was defined as $\alpha = \frac{\partial \rho}{\partial T} \cdot \frac{1}{\rho}$. Values of α were found to be lower

for thin layers, when compared to those of more massive samples, for the same defect density in the crystal structure and for the same ρ_T . Upon cooling, the ρ -T°K curve was lowered considerably, but steadily rose to the same value for heating at high temperatures. Theoretical arguments were given based on adsorption of atoms due to increased surface diffusion and surface tension. In conclusion, the practical uses of nichrome coatings in bolometers were enumerated. Orig. art. has: 3 figures.
